Subject: **Groundwater Monitoring Report – August 2017 Event**
JC Hunt – Wolf Creek Pass Spill
US Highway 160 Milepost 179.5
Apex Project No. 4910

Dear Mr. Stevenson:

On behalf of JC Hunt Company, Inc., Apex Companies, LLC (Apex) is providing you with this groundwater monitoring report for work performed recently at the above-referenced location (Figure 1). This report provides: (1) information on the environmental setting; (2) a summary of the site background; (3) a discussion of site lithology and hydrogeology; (4) a summary of the nature and extent of hydrocarbons; (5) a summary of site remediation activities; and (6) a summary of groundwater monitoring and sampling performed in August 2017.

Environmental Setting

A gasoline tanker truck spill occurred at the west side of mile marker 179.5 on US Highway 160, a few miles north of Wolf Creek Pass, in November 2009. The spill occurred at an elevation of approximately 8,500 feet above sea level. The terrain in the area is mountainous and rocky, with vertical cliffs immediately west of the highway, and a steep rip-rap slope dropping approximately 15 to 20 feet in ground surface level, just east of the highway. A wetlands area with shrubs, grasses, and small trees is present below and to the east of the highway, and borders a stream to the east (South Fork of the Rio Grande River). The area receives heavy snowfall and poor weather during the winter and early spring months, making site work difficult during that time of year.

Site Background

Release Summary and Emergency Response

The gasoline tanker truck spill resulted in the release of approximately 3,800 gallons of gasoline to the subsurface adjacent to Highway 160 in November 2009. As a result, a dissolved gasoline hydrocarbon plume formed under the highway, and to the east of the spill location. Total fluids recovery (TFR) was initiated soon after the spill to recover both mobile non-aqueous phase liquid (NAPL) and groundwater with dissolved hydrocarbons, and many TFR events have been conducted since then. An interceptor trench was installed in the wetlands area to prevent NAPL

migration and to assist with recovery via TFR. No mobile NAPL has been observed at any monitoring locations since the spring of 2010. Source area soils along the side of the highway were excavated to a depth of approximately 2 feet, disposed of offsite, and the excavation was backfilled with clean fill.

Well Installation and Soil Sampling

Monitoring wells MW-1, MW-2, MW-3, MW-4, and MW-5 were installed using overburden drilling excentric (ODEX) methods along the right-of-way of Highway 160 between November 2009 and July 2012. Initial wetlands area monitoring wells were installed relatively shallow, and due to the difficulty with drill rig access at the time, were constructed using hand augering or digging with a mini-excavator (wells T-1 through T-9 and RW-1 through RW-3). Wells were completed using polyvinyl chloride (PVC) well casings and native backfill. Regular groundwater and surface water sampling has occurred at this site since the latter part of 2009 (Tables 1 and 2).

Apex oversaw the installation of three additional monitoring wells to further define subsurface impacts in the wetlands (MW-6, MW-7, and MW-8), and six oxygen biosparge pilot test wells (OX-1, OX-2, MP-1A/B, and MP-2A/B) in June and July 2012. Pilot test wells were placed within proximity of existing groundwater monitoring wells and areas where dissolved petroleum hydrocarbon impacts appeared to be highest within the wetlands. Apex installed the monitoring and pilot test wells with either ODEX or hollow stem auger (HSA) technology to ensure high-quality completions. Well construction in the wetlands include stick-up casings and steel outer protective covers, allowing ease in access and testing of the wells. Soil lithology within the wetlands area consists primarily of alluvial deposits: silty, sandy, gravel with cobbles and a high clay content.

Soil sampling at selected locations was conducted at the site during November 2012, to further define subsurface hydrocarbon impacts in the wetlands. Sample locations included excavation pits and selected drainage channels, as well as locations along the bottom of the northern transect of the interceptor trench. Soil screening and sampling was conducted by targeting the soil/groundwater interface for potential hydrocarbon impacts, so sample depths were generally in the range of 3 to 5 feet below grade. Soils were typically sampled a few inches to a foot below, or adjacent to, exposed soils at pit or trench bottoms. The soil screening and sampling data in the wetlands suggested that only relatively low levels of hydrocarbons were present in soil near the soil/groundwater interface within the hydrocarbon plume area. The complete set of historical soil sampling data is included in the Soil Sampling Activities report, dated December 21, 2012. Soil sample results are also presented in Table 3 and Figure 2.

Chemical Oxidation Infiltration Events

Apex performed two chemical oxidation infiltration events in the source area in September and November 2012. The original spill area in the right-of-way of Highway 160 was infiltrated with a 5,000-gallon (September) and a 6,500-gallon (November) mixture of between 12% and 18% hydrogen peroxide stabilized with sodium phytate. Groundwater sampling results conducted after the infiltration work showed some benzene and hydrocarbon reductions, particularly at

wells nearest to the infiltration area. Wells in the wetlands did not show any significant changes in groundwater concentrations, and it is likely the wells were beyond the range of influence of the infiltration event. Overall, the dissolved benzene results suggested a region of influence due to the chemical infiltration work that extends under the highway, and just into the upgradient portion of the wetlands.

Site Restoration

In May 2013, all pits, holes, and trenches previously excavated were backfilled and compacted to begin restoring the site to natural conditions, maximize the effectiveness of the planned remediation system, and allow proper system operation. Following removal of the plastic liner along the interceptor trench sidewall, the interceptor trench and the 3-foot diameter recovery holes in the treatment area were abandoned and filled. Much of the native vegetation has recovered throughout the wetlands area since then.

Lithology and Hydrogeology

Subsurface soils in the vicinity of the spill have been characterized as tuff bedrock, a very hard and competent bedrock composed of volcanic ash deposits. Cliffs composed of tuff bedrock are visible immediately to the west of the highway and spill location. A substantial amount of riprap and other fill materials are present under the highway to provide structural support for the roadway. Down in the wetlands, alluvial materials (clayey sands, silts, gravels, and cobbles) are present in shallow soils overlying bedrock. Though hydraulic conductivity testing has not been conducted at the site, it is likely that conductivities and groundwater velocities are relatively low, based on apparent hydrogeology and the high percentage of clayey fines encountered during drilling and sampling in the wetlands. Recharge of the deeper pilot test wells (OX-1, OX-2, MP-1B, and MP-2B) during well development was relatively slow, and some pilot test wells (OX-1 and MP-1B) were still not fully recovered one month after installation. Cross-sections showing soil types through the area of investigation are presented as Figures 3 and 4.

Nature and Extent of Hydrocarbon Impacts

Gasoline has impacted soils and groundwater and resulted in a dissolved-phase plume that extends into the wetlands east of the highway. Based on recent sampling results, benzene and other petroleum hydrocarbons are present near the source area by the highway, though hydrocarbon concentrations are much lower in samples collected from the wetland area wells (Table 1). Hydrocarbon concentrations in most well samples decreased substantially in the first few months after the spill due to TFR and natural attenuation, and reductions have been accelerated by chemical oxidation infiltrations and operation of a full-scale bioremediation system. The result of these efforts is that the hydrocarbon plume has attenuated substantially in size and concentration, and many previously impacted wells now have relatively low to non-detectable levels of hydrocarbons in groundwater samples.

Remediation System Summary

Apex began operating a full-scale oxygen injection biosparging system on August 8, 2013 (Figure 1). The system is comprised of 20 oxygen injection wells screened at approximately 12 to 15 feet below ground surface. Each injection well is connected to system control equipment via tubing housed in aboveground PVC conduit. Individual injection well flow rates were operating at approximately 2.5 to 5 standard cubic feet per hour (scfh) of oxygen, and injection pressures ranged from approximately 2 to 5 pounds per square inch (psi). Cleanup goals were largely attained by the fourth quarter (Q4) 2014, and the system was shut down on November 26, 2014 to evaluate potential rebound and readiness for post-operation monitoring.

In spite of the bioremediation system being off for over 5 months, dissolved oxygen (DO) and oxidation-reduction potential (ORP) levels had remained elevated in monitoring wells within the treatment area in the spring of 2015. The elevated DO levels are due to low rates of oxygen consumption due to very low levels of hydrocarbons remaining in the wetlands, combined with naturally high background DO (typically in the range of 6 to 8 mg/L). This elevated DO will continue to naturally degrade remaining hydrocarbons over time, with or without the bioremediation system operating.

The remediation system was restarted on May 5, 2015 at the request of the U.S. Environmental Protection Agency (EPA). The biosparging system ran continuously throughout the remainder of the second quarter and into the fourth quarter of 2015. Per EPA approval, the system was shut off on November 18, 2015. The system has since remained off.

At the direction of the EPA, Apex initiated bi-weekly sampling of the wetlands area monitoring wells (MW-6, MW-7, and T-2) on May 4, 2016. The purpose of the bi-weekly sampling was to closely monitor wetland area groundwater conditions and evaluate the need for further active remediation in the wetlands. Dissolved benzene concentrations in samples collected from wetlands area monitoring wells remained below or only slightly above clean-up goals through Q4 2016. Bi-weekly sampling was discontinued in October 2016, per EPA approval.

Groundwater Monitoring – August 2017 Event

Apex performed the third quarter 2017 groundwater sampling event on August 16, 2017. Groundwater samples were collected from six site monitoring wells, MW-1, MW-2, MW-3, MW-5, MP-1A, and T-2 (Figure 5). The groundwater samples were analyzed for dissolved benzene, toluene, ethylbenzene, xylenes (BTEX), and total volatile petroleum hydrocarbons (TVPH).

As observed over the last several quarters, groundwater sampling results from the quarterly sampling event suggest relatively low concentrations of dissolved benzene remain in groundwater samples collected from monitoring wells within the wetlands area (Figure 5). The groundwater sample collected from wetland area monitoring well MP-1A contained dissolved benzene concentrations below the clean-up goal of 2.2 micrograms per liter ($\mu\text{g}/\text{L}$). However,

dissolved benzene slightly exceeded the clean-up goal in the sample collected from one wetland area monitoring well (T-2) at 12 µg/L. The highest dissolved benzene concentrations have historically been observed during the late summer sampling event, however, it has decreased relative to the August 2016 sampling event (from 13.9 µg/L). Additionally, dissolved oxygen concentrations remain elevated in all wetland wells, and continue to promote intrinsic biodegradation of remaining dissolved hydrocarbons.

For roadside wells, the highest concentrations of dissolved hydrocarbons were observed in the sample collected from well MW-1, located immediately downgradient of the release location. However, the dissolved benzene concentration decreased from 78 µg/L to 47 µg/L from Q2 2017 to Q3 2017. Sample results for roadside wells continue to show an overall decreasing trend in hydrocarbon concentrations. The dissolved benzene concentration in the sample collected from well MW-2 remains above the clean-up goal, however, the dissolved benzene remained below the clean-up goal in the sample collected from well MW-3 for the third consecutive quarter. The average groundwater elevation across the roadside wells decreased approximately 1.9 feet relative to the last quarterly sampling event in April 2017. All groundwater sample results are illustrated on Figure 5. Laboratory correspondence is attached.

Figure 6 presents the estimated groundwater contour elevations and flow directions for the August sampling event. The groundwater gradient for the site continues to be to the east-northeast, consistent with the stream flow direction in this area. Depths to water in the wells installed on the highway near the source (MW-1, MW-2, MW-3, and MW-5) ranged from approximately 18.9 to 26.7 feet below top-of-casing, and as previously stated, were on average approximately 1.9 feet lower than those observed during the Q2 2017 sampling event. Depths to water in wetlands wells near the stream ranged from approximately 1.8 to 3.7 feet below ground surface, and were on average 2.5 feet lower than those observed during the Q2 2017 sampling event.

Summary and Recommendations for Future Work

Groundwater sampling results continue to show steady declines in dissolved hydrocarbons at all site wells over time due to bioremediation in the wetlands, chemical oxidation work in the source area, and ongoing natural attenuation. Elevated dissolved oxygen concentrations observed in all roadside and wetlands area monitoring wells will continue to promote biodegradation of remaining petroleum hydrocarbons over time. Dissolved benzene concentrations are at an all-time low and are continuing to decrease over time, and the remediation system has achieved cleanup of the wetlands to the maximum extent practical.

Apex will continue with monitored natural attenuation of the roadside and wetlands area monitoring wells through the May 2018 sampling event. Per the email exchange with you on May 8, 2017, the oxygen biosparge system will be decommissioned following the November 2017 and May 2018 groundwater sampling events, assuming dissolved benzene concentrations in samples collected from wetland area monitoring wells continue to exhibit decreasing trends.

At that time, Apex will also decrease the groundwater sampling plan to only include sampling of monitoring well MW-1 once or twice a year until groundwater goals have been reached at this well. Following the attainment of clean-up goals at well MW-1, a final sampling event of monitoring wells MP-1A, MP-2A, MW-1, MW-2, MW-3, MW-4, MW-5, MW-6, MW-7, and T-2 will be performed to confirm site-wide clean-up goals have been met.

If you have any questions or need any other information pertaining to this project, please call Steve Annecone at (303) 242-8675.

Sincerely,

Project Name - JC Hunt Wolf Creek

Project Number - 4910-C

Attached are your analytical results for JC Hunt Wolf Creek received by Origins Laboratory, Inc. August 18, 2017. This project is associated with Origins project number Y708239-01.

The analytical results in the following report were analyzed under the guidelines of EPA Methods. These methods are identified as follows; "SW" are defined in SW-846, "EPA" are defined in 40CFR part 136 and "SM" are defined in the most current revision of Standard Methods For the Examination of Water and Wastewater.

The analytical results apply specifically to the samples and analyses specified per the attached Chain of Custody. As such, this report shall not be reproduced except in full, without the written approval of Origin's laboratory.

Unless otherwise noted, the analytical results for all soil samples are reported on a wet weight basis. All analytical analyses were performed under NELAP guidelines unless noted by a data qualifier.

Any holding time exceedances, deviations from the method specifications or deviations from Origins Laboratory's Standard Operating Procedures are outlined in the case narrative.

Thank you for selecting Origins for your analytical needs. Please contact us with any questions concerning this report, or if we can help with anything at all.

Date/time completed: 3-13-17 14:11

Airbill #: N/A

Matrix(s) Received: (Check all that apply): Soil/Solid Water Other:

(Describe)

Cooler Number/Temperature: ✓ 3.0 °C / -1 °C / 0 °C / 1 °C / 2 °C

Thermometer ID: 7003

Requirement Description	Yes	No	N/A	Comments (if any)
If samples require cooling, was the temperature between 0°C to ≤ 6°C ¹¹² ?	/			
Is there ice present (document if blue ice is used)?	/			
Are custody seals present on cooler? (If so, document in comments if they are signed and dated, broken or intact)	/			
Are custody seals present on each sample container? (If so, document in comments if they are signed and dated, broken or intact)		/		
Were all samples received intact ¹¹² ?	/			
Was adequate sample volume provided ¹¹² ?	/			
Are short holding time analytes or samples with HTs due within 48 hours present ¹¹² ? Is a chain-of-custody (COC) present and filled out completely ¹¹² ?		/		
Does the COC agree with the number and type of sample bottles received ¹¹² ?	/			
Do the sample IDs on the bottle labels match the COC ¹¹² ?	/			
Is the COC properly relinquished by the client with date and time recorded ¹¹² ?	/			
For volatiles in water – Is there headspace (> 5% bubble) present? If yes, contact client and note in narrative.		/		
Are samples preserved that require preservation and was it checked ¹¹² ? (note ID of confirmation instrument used in comments) / (preservation is not confirmed for subcontracted analyses in order to insure sample integrity/pH <2 for samples preserved with HNO ₃ , HCl, H ₂ SO ₄) / (pH >12 for samples preserved with NaOH-Na ₂ CO ₃ -NaO ₂ , 2 <i>n</i> Ac-NaOH)		/		
Additional comments (if any):				

¹¹²If NO, then contact the client before proceeding with analysis and note date/time and person contacted as well as the corrective action to in the additional comments (above) and the case narrative.
